Equations of the LAC_SIM model of the E.coli Lac operon (Figure 1):
$\mathrm{v} 1=\mathrm{Vml} /\left(1+(\mathrm{RPf} / \mathrm{Kil})^{\wedge} \mathrm{n} 1\right)$
where RPf is free (unbound) concentration of lac repressor
$\mathrm{v} 2=\beta-\mathrm{Gal}^{*} \mathrm{k} 2$
where $\beta$-Gal is concentration of $\beta$-galactosidase
$\mathrm{v} 3=\mathrm{Vm} 3$ * lactoseC $/($ lactoseC $+\mathrm{Km} 3)$
where lactoseC is cellular lactose concentration; $\mathrm{Vm} 3=\beta-\mathrm{Gal} * \mathrm{TO} 3$
$\mathrm{v} 4=$ lactoseE $^{\star} \mathrm{k} 4$
where lactoseE is extracellular lactose concentration
v5 = permease * k5
where permease is concentration of galactoside permease
$\mathrm{v} 6=\mathrm{Vm6}^{*}$ lactose $\mathrm{E} /($ lactose $\mathrm{E}+\mathrm{Km6}) /(1+\mathrm{I} / \mathrm{Ki} 6)$
where $\mathrm{Vm} 6=$ permease $^{*}$ TO6 and I is an inhibitor of facilitated transport.
v7 $=$ lactoseC * k7
$\mathrm{k} 2, \mathrm{k} 4, \mathrm{k} 5$ and k 7 are first-order rate constants for their respective reactions. Vm1, Vm3 and Vm6 are maximal velocities; Vm1 is a constant, and Vm 3 and Vm 6 are the product of the respective enzyme concentrations and their turnover numbers, TO3 and TO6, respectively; Km3 and Km6 are Michaelis constants; Kil and Ki6 are noncompetitive inhibition constants; n1 and n3 are Hill constants.

Then lactoseE is constant
$\mathrm{d}[$ lactoseC $] / \mathrm{dt}=\mathrm{v} 4+\mathrm{v} 6-\mathrm{v} 3-\mathrm{v} 7$
$\mathrm{d}[\beta-\mathrm{Gal}] / \mathrm{dt}=\mathrm{v} 1-\mathrm{v} 2$
$\mathrm{d}[$ permease $] / \mathrm{dt}=\mathrm{v} 1-\mathrm{v} 5$
$\left.\mathrm{RPf}=\mathrm{RPt} /(1+(\text { lactoseC } / \mathrm{Ki} 3))^{\wedge} \mathrm{n} 3\right)$
where RPt is total (free + alloactose-bound) concentration of lac repressor.
