The movement towards universal health coverage (UHC) is now one of the most prominent global health policies [1]. According to the United Nations Sustainable Development Goals, all UN Member States have agreed to try to achieve Universal Health Coverage by 2030 [2]. This includes financial risk protection, access to quality essential health-care services and access to safe, effective, quality and affordable essential medicines and vaccines for all [2]. As more countries make commitments to universal health coverage, they face challenges on how to quantify it and track progress towards its key goals, both in terms of health services and financial protection coverage. The Joint WHO/World Bank Group report released in 2015 entitled “Tracking universal health coverage: First global monitoring report” provided guidance about how states can achieve universal health coverage and build more resilient health systems [3].

Emphasis should be placed on the role of primary health care in achieving universal health coverage [4]. Health for all is an indispensable need which must be integrated into an overall framework for organising and delivering care based on a patient-centered, efficient, fair, and cost-effective way [5]. According to the World Health Report 2008: Primary Health Care (Now More Than Ever), primary health care can provide such a framework [6]. Patient-centeredness, comprehensiveness, integration and continuity of care are among primary health care’s core features that have been repeatedly associated with better health outcomes, cost-effectiveness and higher user satisfaction [7,8]. However, it is recognised that primary care can offer much more than reduction of costs. A recent study on 102 low- and middle-income countries reported that broader coverage of primary care services was linked to longer life expectancy, lower infant mortality and lower under-five mortality, suggesting that investment in primary care is a wise choice [9]. The increased accessibility even to deprived populations, the provision of long term patient-centered care, the emphasis on prevention, the reduction of unnecessary medical care are among the benefits that a strong primary health system can offer, narrowing the gap between socially deprived and advantaged populations [5]. Strengthening primary health care systems, combined with financial protection by universal coverage, seems to be the gold pathway to achieve health for all.
