Abstract
Camel milk is nutritious milk which is consumed in some pastoral areas in Iran. Preparing the fortified camel milk using different fruits can be effective for decreasing the undernourishment in many areas. In this study effect of Orange and Cherry syrups at different concentrations (5, 10, 15%) on bacteriological and sensory properties of camel milk studied. Results revealed that samples contain Orange 10% gained highest scores and then Cherry milk (15%) was better. Milk contains 5% Cherry syrup gained lower scores in comparison to control sample. Bacteriological results showed changes in Total counts (Cfu/ml) in camel milks containing different concentrations of Cherry and Orange syrup. The Total counts in Orange and Cherry fortified camel milk decreased from high concentration to low concentration and were 730, 680, 490 Cfu/ml and 310, 240, 160 Cfu/ml at 5, 10 and 15% concentrations, respectively. Whereas, no changes in the yeast and mold counts at all concentration of pasteurized camel milk (control and fruit milks) and were zero. Accordingly, Orange and Cherry syrups can be use in production of fruit fortified camel milk for human nutrition.

Introduction
There is a direct relationship between nourishment and health. Use of nutritious foods help in increasing life expectancies and increase resistance against some diseases. Camel milk in comparison to other ruminant milk is low in cholesterol, sugar and protein, but high in minerals (sodium, potassium, iron, copper, zinc and magnesium), vitamins A, B2, C and E, and contains a high concentration of insulin and milk solids in addition to nutrients as lactoferin, immunoglobulins, antimicrobial agents and some one [1]. Camel milk has not allergic properties and can be consumed by lactase-deficient individuals and those with weakened immune system. Present in many regions camel milk is used against some diseases such as Dropsy, Jaundice, problems of the Spleen, Tuberculosis, Asthma, Anaemia, and Piles, in fact This milk believed to have medicinal properties [2,3]. Chronic hepatitis of Patients had improved after treating with camel milk and its fermented products [4]. Camel milk was as effective as ass milk and superior to treatment with only medication or a diet consisting of cow milk protein. The camel milk works as a laxative on people unaccustomed to drinking this milk [2]. Camel milk is said to be of such strength, and have such health properties, that all the bacteria are driven from the body [5]. Orange is good source of vitamins especially vitamin C. Also Eberhard and Bower [6] observed that orange juice resulted in increase in the free and total acidity in the stomach and help in better digestion of proteins. Cherry is rich in antioxidants, anthocyanins and melatonin which may help aid with sleep. Research suggests cherry reduce inflammation [7-9], ease the pain of arthritis and gout, protection against heart disease and certain cancers [10], reduce the risk of diabetes and insulin resistance syndrome and prevention of memory loss [11]. Accordingly, production of new fortified camel milk which is nutritious can be a ideal matter for public nutrition. The objective of this study was to inspect for production the flavored camel milk using different concentrations of orange and cherry syrup and determine the effects of concentration syrups on microbiological and sensory properties of fortified camel milk.

Materials and methods

Materials
Cherry and orange syrup used in this study were pasteurized commercial products from Sanich Company, Iran. Their compositions according to manufacturer’s data were: Natural cherry concentrate, Sugar, Water, Citric acid (E330) and Natural orange concentrate, Sugar, Water, Citric Acid (E330), Ascorbic Acid (Vitamin C) E330, Beta-carotene (Vitamin A) 160a, Pectin (E440) and orange flavor respectively. Camel milk obtained from Aghghala city. The composition of the camel milk as determined by AOAC (1990) [12] that included, Water 86.5%, Ts 13.5%, (Fat 4.4%, Ash .9%, Lactose 4.3% and Protein 3.9%), pH equal to 6.6 and titratable acidity 15D. Also 0.3% Sodium aleginate is used as stabilizer.

Preparation of fortified camel milks
Raw camel milk pasteurized at 72°C for 15 sec. Three levels of cherry and orange syrup (5, 10 and 15%) were used in this study. Fruit syrups and stabilizer were added to pasteurized camel milk under sterile conditions and followed by stirring with a sterile spoon until Homogenous. Then produced flavored camel milk used for analysis the sensory properties and for microbiological assay, first make serial dilutions from samples. Also a control batch (without any syrup) was considered.

Results and discussion

Microbiological assay

For examination the microbial growth, first serial dilutions from samples make in sterile Distilled water and plating in Plate count agar (Mirmedia, Iran) for Total counts, in Manitol salt agar (micro media, Hungary) for S. aureus counts, in VRBA (micro media, Hungary) for Enterobacteriaceae counts and in YGC agar (Mirmedia, Iran) for yeast and mold counts. Plates were incubated at 37°C for 48 h for bacteria and at 30°C for 5 d for yeast and mold counts. Results given in Table 1. These results show changes in total counts (cfu/ml) in raw camel milk and camel milks containing different concentrations of cherry and orange syrup.

The total counts in orange and cherry fortified camel milks decreased from high concentrations to low concentrations i.e. from 730, 680, 490 Cfu/ml and 310, 240, 160 Cfu/ml at 5, 10 and 15% concentrations, respectively. Orange milk has high total counts in comparison with cherry milk. Whereas, no changes in the yeast and mold counts at all concentration of pasteurized camel milk (control and fruit milk) and all of them were zero.

It is clear that the total counts especially for raw camel milk exceed. But because of the pasteurization treatment, they may not necessarily pose a hazard to the health of the consumers (pasteurization is known as treatment which destroys all spoilage and hazardous microorganisms). Table 2 showed there were no any Enterobacteriaceae in raw milk.

Sensory evaluation

Panellists were selected based on interest, time available, and a liking for Camel milk (n=6). Panellists were university students, 3 were female and 3 were male and ages ranged from 20 to 27 years. During training, panellists discussed terms and attributes and learned to consistently use the scale. Panellists evaluated each treatment within a second 15% cherry among the camel milks with added fruit. Hence, it is concluded that addition of 10% orange syrup and 15% cherry in camel milk improve the organoleptic as well and nutrition properties of camel milk.

This study recommends a new variety of fruit fortified camel milk particularly rich in nutrition compounds and has pleasant flavor which can be manufactured by utilizing cherry and orange fruits.

Also if heat treatment achieve correctly, fortified camel milk has acceptable colony counts, but for prevention from spoilage, these products need a cold chain for their storage and distribution.
